

Sleep and Breathing Baby Monitor

SafeToSleep® provides reliable, technologically-advanced devices that support and promote infant sleep safety, providing peace of mind for new parents, allowing them to feel confident and assured as caregivers.

Product

A breakthrough in infant sleep safety, the Sleep and Breathing Monitor is the first of its kind to use state-of-the-art fiber optic technology to measure and record each baby breath and stream it to a smartphone as it occurs, so parents know at a glance that their baby is breathing safely.

The Sleep and Breathing Monitor brings together patented technology to create a comprehensive sleep and breath monitoring system that has been hospital tested and clinically validated for accuracy. The unit features:

- **Sleep Mat™** - a wireless, portable soft sleep surface that monitors a sleeping baby's breathing pattern and breath rate
- **BreathScope™** - detects every baby breath and displays the breath wave and breath rate on a smartphone in real time
- **BreathTrend™** - analyzes baby's breathing data and generates real-time alerts for abnormal breathing events
- **SleepLog™** - tracks sleep time and generate sleep quality reports to give parents and doctors a new window into baby wellness
- **Parent Unit** – the handheld device used to monitor baby when not using a smartphone

The only baby monitor that can monitor the breath rate, activity, sound, and movement of a sleeping baby, the Sleep and Breathing Monitor is set to revolutionize the infant sleep safety industry with its innovative and groundbreaking system.

SafeToSleep® is on a mission to protect the wellness of sleeping babies everywhere and to improve infant care through the invention, improvement, and application of user-friendly and intuitive technologies.
